

Analog Line PC Call Recording

For Analog Trunks or Analog Stations

Telephone conversations on analog trunks or lines may be recorded digitally to a PC using the Algo 4105 Analog Auxbox which connects the analog telephone line to a USB port of a PC. Calls are recorded using the Algo Client Call Recorder (CCR) software included with the 4105 Analog Auxbox.

Since the Analog Auxbox connects to the telephone line instead of the telephone itself, calls can be recorded for any telephone (or telephone system) accessing the line.

Unlike telephone handset taps, the Analog Auxbox also permits recording of cordless and hands-free telephones. Caller ID and dialed number are also stored by the software and call records can be easily archived, emailed, or played back.

Requirements

- 4105 Analog AuxBox
- Customer Supplied PC with Windows 98SE, ME, 2000, or XP and an available USB port

For Multi-Line Recording:

The 4105 Analog Auxbox is supported by Algo's Enterprise Call Recorder which supports up to 32 lines on a single PC and provides additional multi-user and supervisor features. See www.algosolutions.com/pdf/AN-0309.pdf for more information.
