

Overview of Visual In-Use Indication

Visual indication of a telephone's in-use status, through the use of a highly visible light, is important in order to prevent disruptions to important calls and to minimize the inadvertent transmission of background conversations.

For people who work in close contact with co-workers and frequently use the telephone – especially with a headset or hands-free model – a bright in-use light can ensure a more effective and secure telephone environment.

Algo offers two basic solutions for Visual In-Use indication that are compatible with Nortel Digital, Meridian Digital Centrex, IP Softphone 2050, and Analog telephones: The Algo 1127P Visual Alerter and the Algo 1126P Strobe Light, both of which can be used interchangeably depending on the application.

The 1127P Desktop Visual Alerter provides a highly visible green, blue or red light that is noticeable from all directions, with one of four distinct light patterns as selected by the option switch. The 1127P can be located on the desktop, on a cubicle wall, on top of a computer monitor, or anywhere else deemed desirable.

For brighter wider area notification, the Algo 1126P Strobe Light can be used. This is a high-intensity light ideal for warehouses or call centers.
